The Infrastructure Bottleneck

Native inspection requires massive overhead and enduring an endless UI maze.

Heavy Infrastructure

- Requires active database connections.
- Dependent on high-latency VPNs.

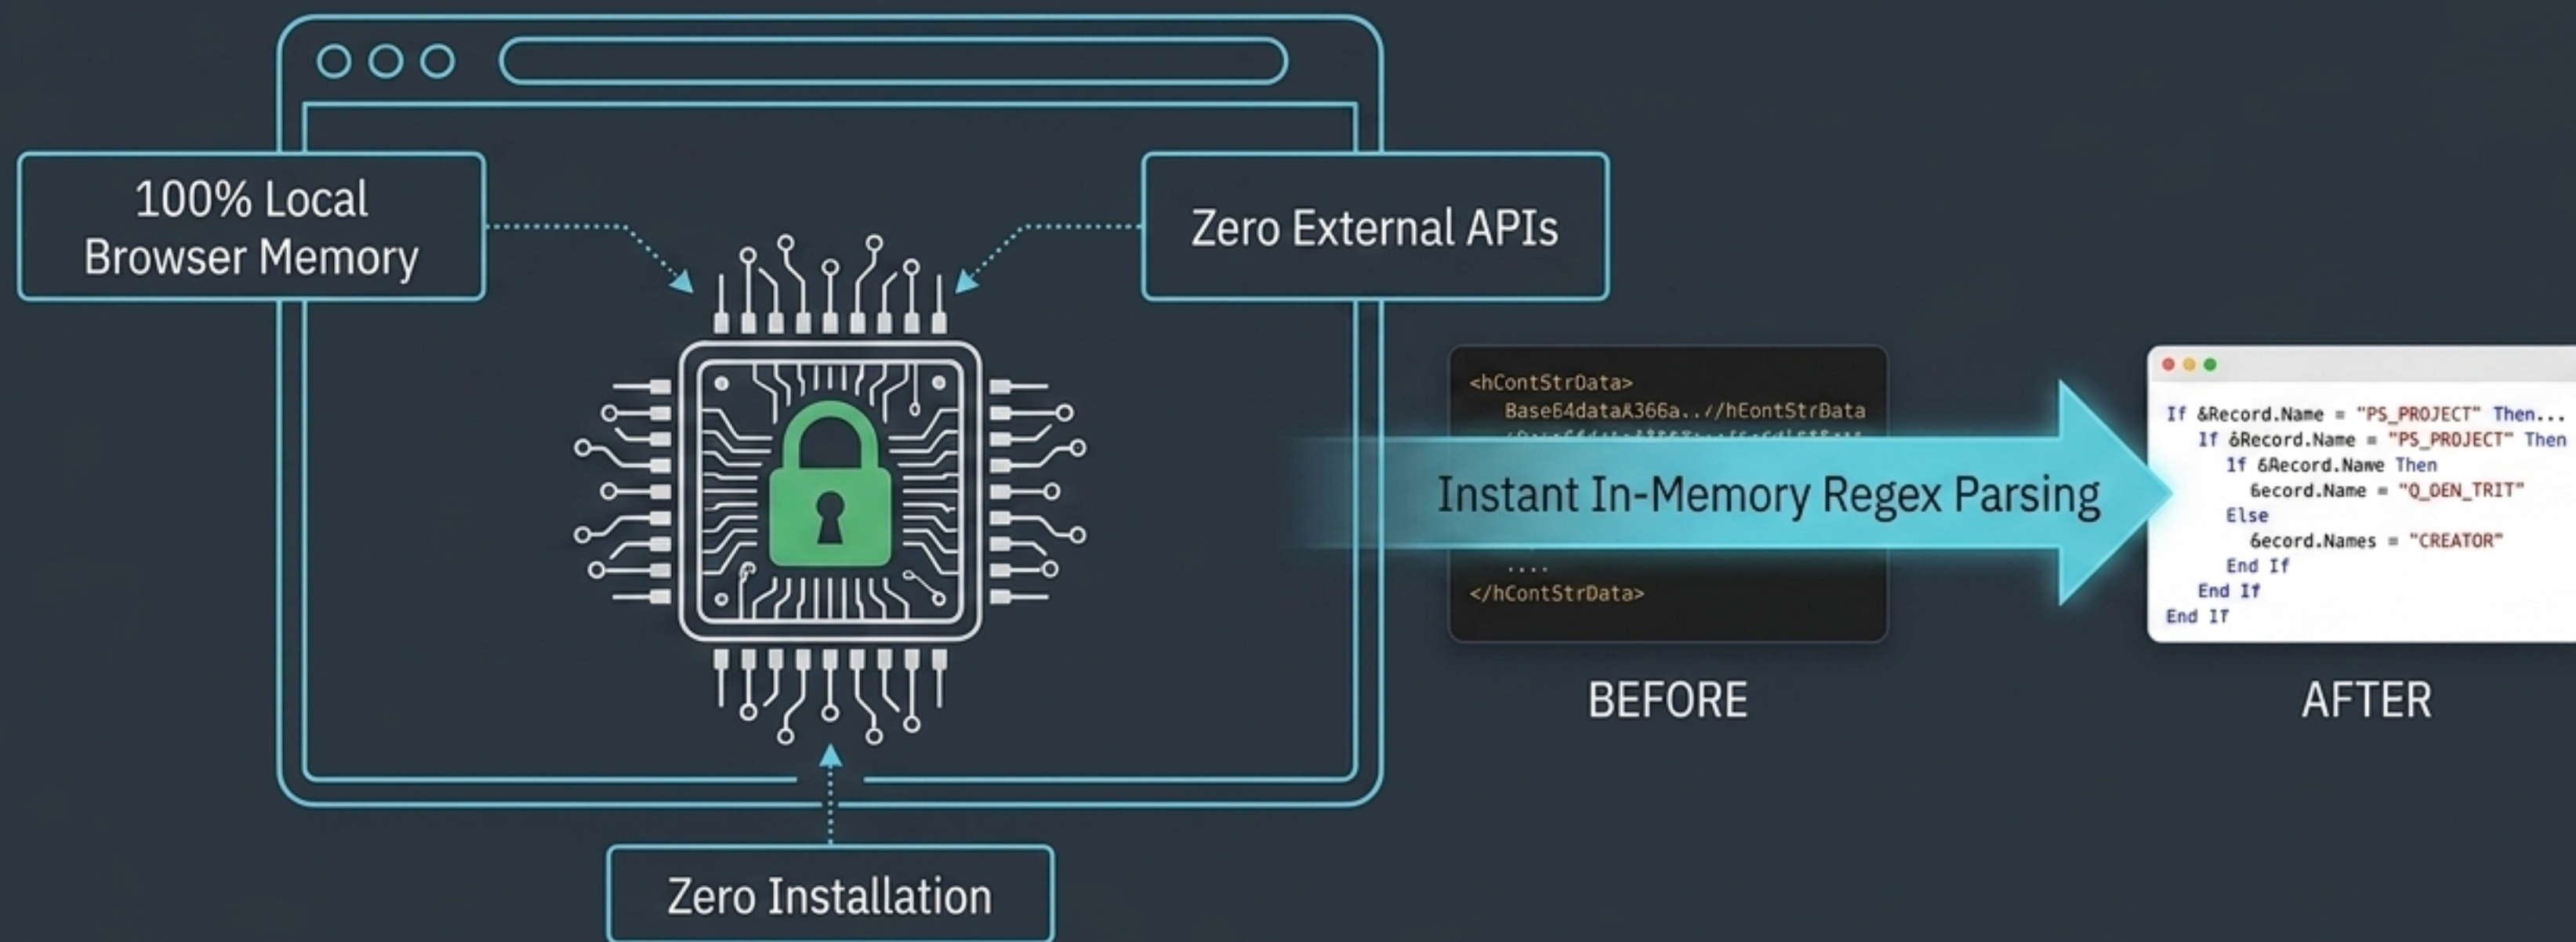

The Click-Loop & Hidden Data

- 12-Menu Click-Loop wasted just to inspect a single line of code.
- Buried Audit Data hidden across multiple property tabs.
- Trapped logic creates blind peer reviews.

A Zero-Footprint Architecture

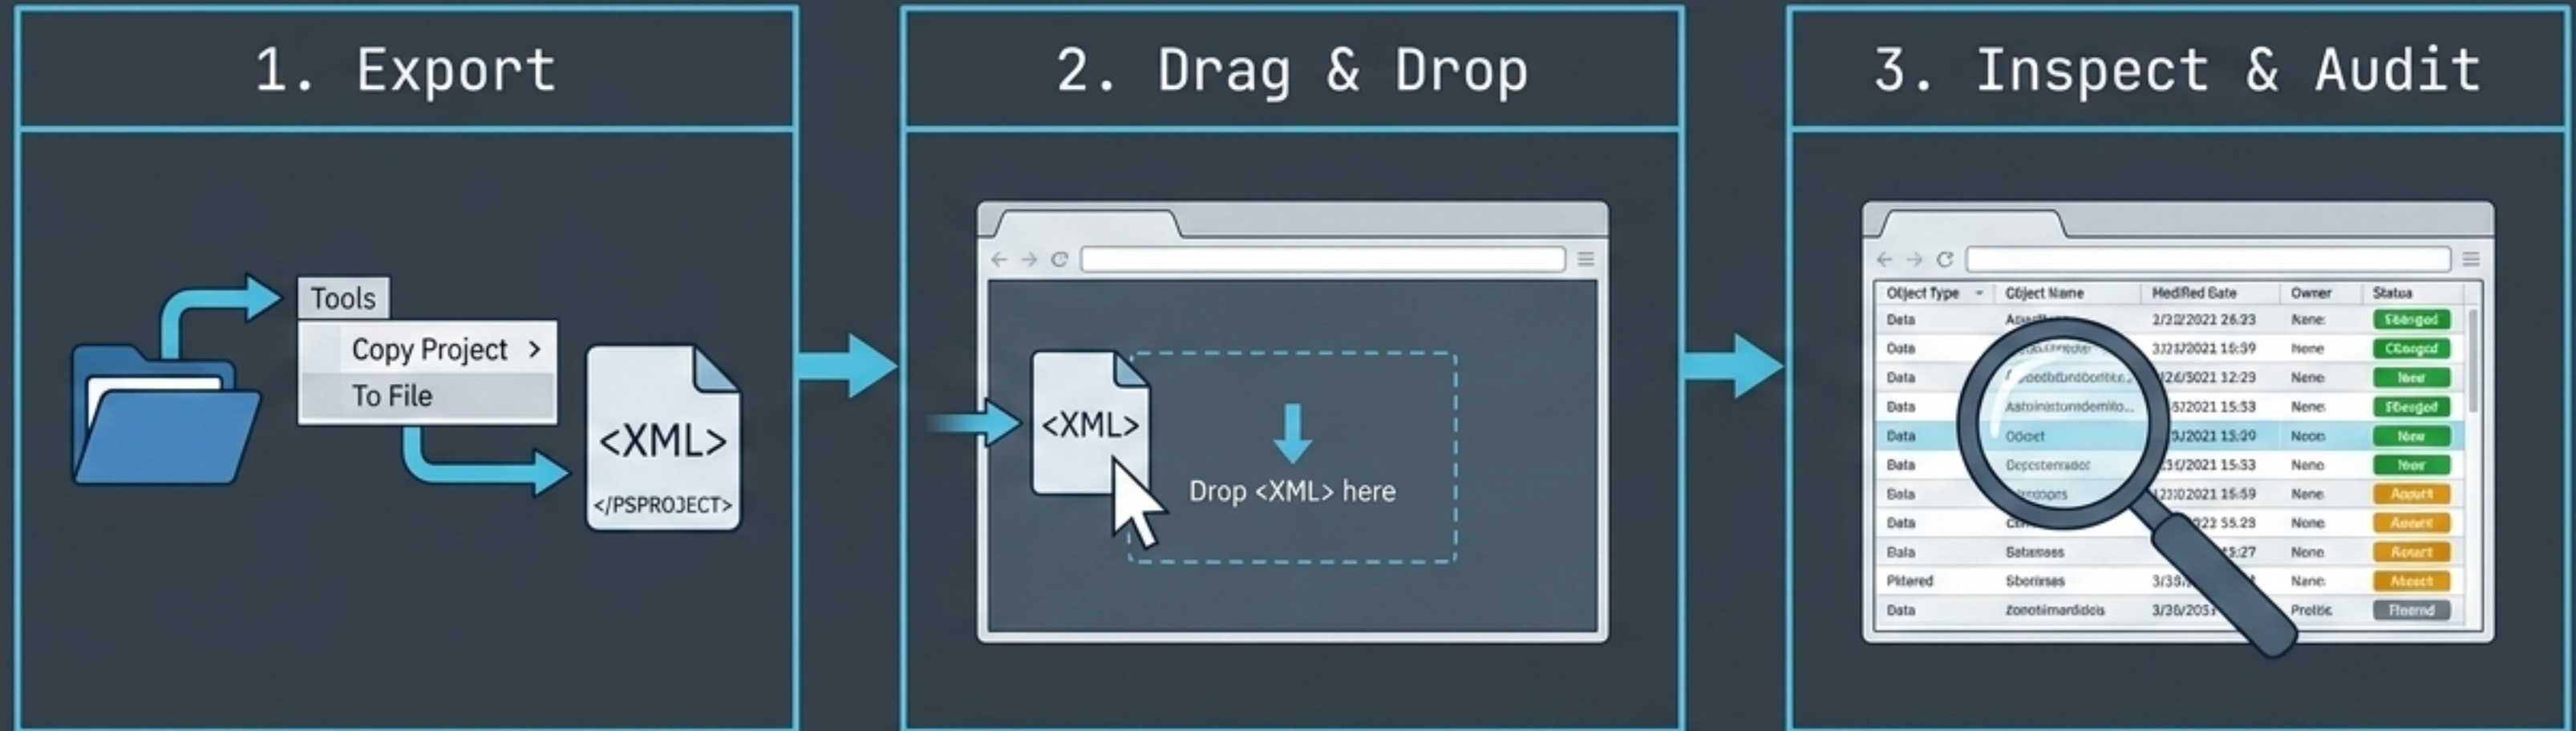

Instantly parse XML into a searchable dashboard without any environment overhead.

Sensitive enterprise metadata never leaves your local machine.

Three Steps to Actionable Intel

Bypassing the native bottleneck requires zero installation and zero configuration.

In Application Designer: Copy Project to File to generate your XML.

Drop the XML file into the secure HTML utility. Parsing happens instantly in local memory.

Browse, filter by status, and inspect auto-decoded source code.

Rescuing Trapped Code & Metadata

Deep metadata extraction without ever opening a property tab.

Audit Header Extraction

Surfaces project-level audit headers and timestamps instantly.

1

Explicit Subtype Badging

Instantly distinguishes if a Record is a SQL Table, View, or Derived.

2

Auto-Decoded Logic

Fragmented SQL and obscured PeopleCode are automatically reassembled into readable blocks.

3

Details Panel

Object Properties: EMPLOYEE_SRCH (Record)

Audit Headers

Last Updated By: **PTDV**

Source Operator: **PS**

Type: **SQL Table**

```
&Record = GetRecord(RECORD.NAME);  
&Record.SetKeys("EMPLID", &Emplid);  
&Record.SelectByKey();  
If &Record.IsChanged Then  
    &Record.Save();  
End-If;
```

Automated Documentation

Generate ready-made paper trails for every project migration.

12-Column Manifests

Instantly generate complete, comma-separated metadata logs. Perfect for pasting directly into release checklists and migration trackers.

Print-Optimized Summaries

Export clean, formatted PDF summaries. Attach them directly to change tickets to serve as automated Technical Design Documents.

Impact Across the Release Cycle

Speed, accountability, and zero data leakage across the entire DevOps lifecycle.

Developers

Slash Review Time

Instantly isolate modified objects. Built-in selectors strip away hundreds of unchanged records to focus strictly on new logic, transforming hours-long peer reviews into targeted inspections.

Architects

Pre-Migration Confidence

Verify source operator and timestamps completely offline before a file ever hits a target environment. X-ray complex object mappings without active database access.

Security Managers

Zero Leakage

Parsing happens 100% locally in browser memory. Zero external APIs ensure sensitive enterprise metadata never leaves the machine.

Replacing Blind Trust with Transparency

A feature-by-feature diagnostic of Native Application Designer vs. Project Insights.

	Native App Designer	Project Insights
Infrastructure	✗ High-Latency VPN & Database	✓ 100% Offline / Standalone HTML
Navigation	✗ Nested 12-Menu UI	✓ Instant Drag-and-Drop Data Grid
Code Visibility	✗ Trapped & Obscured in XML	✓ Auto-Decoded & Syntax Highlighted
Peer Reviews	✗ Manual search for modifications	✓ Instant 'Changed' / 'Absent' Filters
Audit Headers	✗ Buried across property tabs	✓ Extracted at a glance

Getting Started Today

Stop migrating code you haven't explicitly verified.

Ready Instantly: A single, self-contained HTML file. No dependencies, no setup, no server configuration.

- **Step 1:** Download the utility file.
- **Step 2:** Open in Chrome or Edge.
- **Step 3:** Drop in your next project XML.

100% Free & Open Source. Download today, and if it saves you time, please give the GitHub repository a Star!
